Summary —

Rust compiler engineer, member of the Compiler and Mentors teams in the Rust project. Most of my time goes to reviewing compiler PRs; my own work is in the rustc front-end: parsing, diagnostics, const generics, pattern matching. Outside the Rust project, I work at T-Bank on distributed storage infrastructure in Rust, and help contributors in the Rust for CPython effort.

Experience

Rust Project
Compiler Team — *November 2025 – present*
Mentors Team — *June 2026 – present*
Contributor — *April 2025 – present*

- 100+ merged PRs and 200+ reviewed PRs since April 2025.

Language and library features

- if let guards - took the feature to stabilization: the final compiler changes, a test suite covering drop order, temporary scopes and moves out of guards, and the Reference update (write-up).
- Raw references to union fields - no longer require unsafe. Changed the THIR unsafety checker, got it through a joint T-lang/T-opsem FCP, and ported the rule to rust-analyzer.
- min_generic_const_args (the const generics MVP) - made tuple and const constructors usable as const arguments, closing six old issues.
- Stabilized nine library APIs, among them array_repeat, strict_provenance_atomic_ptr and btree_entry_insert.

Compiler changes

- Part of the next trait solver rollout: enabled -Znext-solver by default on nightly, and added -Z min-recursion-limit (MCP) so crates hitting the new solver's recursion depth can raise the limit without source changes.
- Made annotate-snippets the default error renderer on stable, after its MCP.
- The parser now recovers from attributes on types and generic arguments instead of aborting.

Tests and mentoring

- Moved and cleaned up 500+ tests in tests/ui over two weeks (32 PRs), finishing the first milestone of the reorganization.
- Turned the follow-up tests/ui/issues cleanup into a Google Summer of Code 2026 project, which I mentor.

Education

Surgut Polytechnic College
Diploma in Instrumentation & Control Engineering — *September 2021 – June 2025*

- Programmed microcontrollers and PLCs for industrial control systems.

Skills

Languages: Rust, C, Python
Compilers: rustc front-end (parsing, diagnostics, unsafety checking, const generics, pattern matching)
Systems: unsafe Rust, FFI, memory layout, proc macros, Linux, eBPF
Tooling: Git, jj, Cargo, CI
Spoken: English (B2), Russian (native)
